Software Product Description

PRODUCT NAME: HP Fortran for OpenVMS

DESCRIPTION

This is the Software Product Description (SPD) for HP Fortran (formerly Compaq Fortran) Version 8.0 for OpenVMS™ Alpha Systems, and HP Fortran Version 8.1 for OpenVMS Integrity Servers (I64). HP Fortran on OpenVMS Alpha contains the HP Fortran 95/90 Version 8.0 software and the HP Fortran 77 Version 8.0 software as well as the HP Extended Math Library (CXML). In the following description, HP Fortran refers to HP Fortran 95/90 unless a specific reference to the 95/90 or 77 product is needed to distinguish between the two software products.

HP Fortran is an implementation of the Fortran programming language that supports the FORTRAN 66, FORTRAN 77, Fortran 90, and Fortran 95 standards. HP Fortran 95/90 and HP Fortran 77 fully support the following standards:

- ANSI X3.9-1966 (FORTRAN 66)
- ANSI X3.9-1978 (FORTRAN 77)
- ISO 1539-1980(E) (FORTRAN 77)
- MIL-STD-1753
- FIPS-69-1 (HP Fortran meets the requirements of this standard by conforming to the ANSI Standard and by including a flagger. The flagger optionally produces diagnostic messages for compile-time elements that do not conform to the Full-Level ANSI Fortran Standard.)

HP Fortran 95/90 supports all of the standards that HP Fortran 77 supports plus the following new standards:

- ANSI X3.198-1992 (Fortran 90)
- ISO/IEC 1539-1:1997(E) (Fortran 95)

HP FORTRAN

HP Fortran supports extensions to the ISO and ANSI standards, including a number of extensions defined by HP Fortran for the various HP Fortran platforms (operating system/architecture pairs). In addition to HP OpenVMS Alpha and I64 systems, HP Fortran platforms include:

- HP Fortran and HP Fortran 77 on HP Tru64™ UNIX® Alpha systems
- HP Fortran 77 for OpenVMS VAX™ systems

Major additions to the FORTRAN 77 standard introduced by the Fortran 90 standard include:

- Array operations
- Improved facilities for numeric computation
- Parameterized intrinsic data types
- User-defined data types
- Facilities for modular data and procedure definitions
- Pointers
- The concept of language evolution
- Support for DATE_AND_TIME intrinsic for obtaining dates using a four-digit year format

HP Fortran contains full support for the Fortran 95 standard, including the following features:

- FORALL statement and construct
- Automatic deallocation of ALLOCATABLE arrays
- DIM argument to MAXLOC and MINLOC
- PURE user-defined subprograms

June 2006
• ELEMENTAL user-defined subprograms (a restricted form of a pure procedure)
• Pointer initialization (initial value)
• The NULL intrinsic to nullify a pointer
• Derived-type structure initialization
• CPU_TIME intrinsic subroutine
• KIND argument to CEILING and FLOOR intrinsics
• Nested WHERE constructs, masked ELSEWHERE statement, and named WHERE constructs
• Comments allowed in namelist input
• Generic identifier in END INTERFACE statements
• Minimal width field editing using a numeric edit descriptor with 0 width
• Detection of Obsolescent and/or Deleted features listed in the Fortran 95 standard. HP Fortran flags these obsolescent and deleted features, but fully supports them.

HP Fortran includes the following features and enhancements:
• CDD (Common Data Dictionary) support and DML (Data Manipulation Language) support, formerly only available in the old Fortran 77 (/old_f77) compiler, are now available in the Fortran 90/95 compiler
• Full support for 64-bit address space, including 64-bit static space
• Support for linking against static and shared libraries
• Support for creating shareable code to be put into a shared library
• Support for stack-based storage
• Support for dynamic memory allocation
• Support for reading and writing binary data files in nonnative formats, including IEEE® (little-endian and big-endian), VAX, IBM® System/360, and CRAY® integer and floating point formats
• User control over IEEE floating point exception handling, reporting, and resulting values
• Control for memory boundary alignment of items in COMMON and fields in structures and warnings for unaligned data
• Directives to control listing page titles and subtitles, object file identification field, COMMON and record field alignment, and some attributes of COMMON blocks
• Ability to CALL an external function subprogram
• 7200 Character Statement Length
• Free form unlimited line length
• Mixing Subroutines/Functions in Generic Interfaces
• Composite data declarations using STRUCTURE, END STRUCTURE, and RECORD statements, and access to record components through field references
• Explicit specification of storage allocation units for data types such as:
  
  ```
  INTEGER*4
  LOGICAL*4
  REAL*4
  REAL*8
  COMPLEX*8
  ```
• Support for 64-bit signed integers using INTEGER*8 and LOGICAL*8
• Support for 128-bit floating-point real numbers (reals) using REAL*16 and COMPLEX*32
• A set of data types:
  — BYTE
  — LOGICAL*1, LOGICAL*2, LOGICAL*4, LOGICAL*8
  — INTEGER*1, INTEGER*2, INTEGER*4, INTEGER*8
  — REAL*4, REAL*8, REAL*16
  — COMPLEX*8, COMPLEX*16, DOUBLE COMPLEX, COMPLEX*32
  — POINTER (CRAY style)
• Data statement style initialization in type declaration statements
• AUTOMATIC and STATIC statements
• Bit constants to initialize LOGICAL, REAL, and INTEGER values and participate in arithmetic and logical expressions
• Built-in functions %LOC, %REF, %VAL, and %DESCR
• VOLATILE statement
• Bit manipulation functions
• Binary, hexadecimal, and octal constants and Z and O format edit descriptors applicable to all data types
• I/O unit numbers that can be any nonnegative INTEGER*4 value
• Variable amounts of data can be read from and written to “STREAM” files, which contain no record delimiters
• ENCODE and DECODE statements
HP Fortran for OpenVMS

- ACCEPT, TYPE, and REWRITE input/output statements
- DEFINE FILE, UNLOCK, and DELETE statements
- USEROPEN subroutine invocation at file OPEN time
- Support for reading nondelimited character strings as input for character NAMELIST items
- Debug statements in source
- Generation of a source listing file with optional machine code representation of the executable source
- Variable format expressions in a FORMAT statement
- Optional run-time bounds checking of array subscripts and character substrings
- 31-character identifiers that can include dollar sign ($) and underscore (_)
- Support for executing in-line assembler code using the ASM intrinsics (Alpha only)
- Support for the supercomputer intrinsics POPCNT, POPPAR, LEADZ, TRAILZ, and MULT_HIGH
- Language elements that support the various extended range and extended precision floating point architectural features:
  - 32-bit VAX F_floating data type, with an 8-bit exponent and 24-bit mantissa, which provides a range of $0.293873588E-38$ to $1.7014117E38$ and a precision of typically 7 decimal digits. Calculations with F_floating data on I64 are performed using the S_floating data type.
  - 64-bit VAX D_floating data type, with an 8-bit exponent and 56-bit mantissa, which provides a range of $0.2938735877055719D-38$ to $1.70141183460469229D38$ and a precision of typically 16 decimal digits. Calculations with D_floating data on Alpha systems use G_floating precision (53-bit instead of 56-bit mantissa). Calculations with D_floating data on I64 are performed using the T_floating data type.
  - 32-bit IEEE S_floating data type, with an 8-bit exponent and 24-bit mantissa, which provides a range of $1.17549435E-38$ (normalized) to $3.40282347E38$ (the IEEE denormalized limit is $1.40129846E-45$) and a precision of typically 7 decimal digits
  - 64-bit IEEE T_floating data type, with an 11-bit exponent and 53-bit mantissa, which provides a range of $2.250738585072013D-308$ (normalized) to $1.7976931348623158D308$ (the IEEE denormalized limit is $4.94065645841246544D-324$) and a precision of typically 15 decimal digits
  - 128-bit IEEE extended Alpha X_floating data type, with a 15-bit exponent and a 113-bit mantissa, which provides a range of approximately $6.48Q-4966$ to $1.18Q4932$ and a precision of typically 33 decimal digits
- The following combinations of floating types may be specified:
  - F, G and X (the default on Alpha)
  - F, D and X (VAX)
  - S, T and X (IEEE) (the default on I64)
- Command line control for:
  - The size of default INTEGER, REAL, and DOUBLE PRECISION data items
  - The levels and types of optimization to be applied to the program
  - The directories to search for INCLUDE files
  - Inclusion or suppression of various compile-time warnings
  - Inclusion or suppression of run-time checking for various I/O and computational errors
  - Control over whether compilation terminates after a specific number of errors has been found
  - Choosing whether executing code will be thread-reentrant
- Internal procedures can be passed as actual arguments to procedures
- Kind types for all of the hardware-supported data types:
  - For 1-, 2-, 4-, and 8-byte LOGICAL data:
    - LOGICAL (KIND=1)
    - LOGICAL (KIND=2)
    - LOGICAL (KIND=4)
    - LOGICAL (KIND=8)
  - For 1-, 2-, 4-, and 8-byte INTEGER data:
    - INTEGER (KIND=1)
    - INTEGER (KIND=2)
    - INTEGER (KIND=4)
    - INTEGER (KIND=8)
  - For 4-, 8-, and 16-byte REAL data:
    - REAL (KIND=4)
    - REAL (KIND=8)
    - REAL (KIND=16)
— For single precision, double precision, and quad-
precision COMPLEX data:
  
  COMPLEX (KIND=4)
  COMPLEX (KIND=8)
  COMPLEX (KIND=16)

HP Fortran takes advantage of OpenVMS facilities to 
include the following features and enhancements in both 
HP Fortran 95/90 and HP Fortran 77:

• Language elements for keyed and sequential access 
to OpenVMS RMS indexed organization files

• The ability to specify an OpenVMS text library mod-
ule in an INCLUDE statement

• Support for calls to OpenVMS system service and 
Run-Time Library procedures

• Generation of symbol tables for the OpenVMS Sym-
bolic Debugger

• LIB$ESTABLISH and LIB$REVERT are provided as 
intrinsic functions for compatibility with HP Fortran 
exception handling

• Support for providing error diagnostics to the DEC 
Language-Sensitive Editor component of DECset for 
OpenVMS

• FDML (Fortran Data Manipulation Language) support 
(I64 only)

HP Fortran 77 contains the following extensions to the 
FORTRAN 77 standard: (Alpha only)

• Support for recursive subprograms

• IMPLICIT NONE statements

• INCLUDE statement

• NAMELIST-directed I/O

• DO WHILE and ENDDO statements

• Use of exclamation point (!) for end of line comments

• Generation of Cross Reference Listings

• Support for NTT Technical Requirement TR550001, 
Multivendor Integration Architecture (MIA) Version 
1.1, Division 2, Part 3-2, Programming Language 
FORTRAN

• Support for automatic arrays

• Support for the SELECT CASE - CASE - CASE DE-
FAULT - END SELECT statements

• Support for the EXIT and CYCLE statements and for 
construct names on DO - END DO statements

• Reporting of unused and uninitialized variables

• Support for DATE_AND_TIME intrinsic for obtaining 
dates using a four-digit year format

HP Fortran 77 takes advantage of OpenVMS facilities 
to include the following features and enhancements:

• Support for translation of CDD/Repository records 
into Fortran records for Fortran F77 on OpenVMS 
Alpha and Fortran F90 on OpenVMS I64

• Support for the extraction of program design informa-
tion in comments using the DEC Source Code 
Analyzer component of DECset for OpenVMS

HP Fortran provides a multiphase optimizer that is capa-
bile of performing optimizations across entire programs. 
Specific optimizations performed by both HP Fortran 
95/90 and Compaq Fortran 77 include:

• Constant folding

• Optimizations of arithmetic IF, logical IF, and block 
IF-THEN-ELSE

• Global common subexpression elimination

• Removal of invariant expressions from loops

• Global allocation of general registers across program 
units

• In-line expansion of statement functions and routines

• Optimization of array addressing in loops

• Value propagation

• Deletion of redundant and unreachable code

• Loop unrolling

• Thorough dependence analysis

• Software pipelining to rearrange instructions between 
different unrolled loop iterations

• Optimized interface to intrinsic functions

• Loop transformation optimizations that apply to array 
references within loops, including:
  — Loop blocking
  — Loop distribution
  — Loop fusion
  — Loop interchange
  — Loop scalar replacement
  — Outer loop unrolling

Specific optimizations performed by HP Fortran 95/90 
include:

• Array temporary elimination

Both HP Fortran 95/90 and HP Fortran 77 are share-
able, re-entrant compilers that operate under the Open-
VMS operating system. They globally optimize source 
programs while taking advantage of the native instruc-
tion set and the OpenVMS virtual memory system.
HP EXTENDED MATH LIBRARY (CXML) ALPHA ONLY

HP Extended Math Library (CXML) for OpenVMS Alpha is a set of mathematical subprograms that are optimized for HP architectures. Included subprograms cover the areas of:

- Basic Linear Algebra
- Linear System and Eigenproblem Solvers
- Sparse Linear System Solvers
- Sorting
- Random Number Generation
- Signal Processing

The Basic Linear Algebra library includes the industry-standard Basic Linear Algebra Subprograms (BLAS) Level 1, Level 2, and Level 3. Also included are subprograms for BLAS Level 1 Extensions, Sparse BLAS Level 1, and Array Math Functions (VLIB).

The Linear System and Eigenproblem Solver library provides the complete LAPACK v2 package developed by a consortium of university and government laboratories. LAPACK is an industry-standard subprogram package offering an extensive set of linear system and eigenproblem solvers. LAPACK uses blocked algorithms that are better suited to most modern architectures, particularly ones with memory hierarchies. LAPACK will supersede LINPACK and EISPACK for most users.

The Sparse Linear System library provides both direct and iterative sparse linear system solvers. The direct solver package supports both symmetric and nonsymmetric sparse matrices stored using the skyline storage scheme. The iterative solver package contains a basic set of storage schemes, preconditioners, and iterative solvers. The design of this package is modular and matrix-free, allowing future expansion and easy modification by users.

The Signal Processing library provides a basic set of signal processing functions. Included are one-, two-, and three-dimensional Fast Fourier Transforms (FFT), group FFTs, Cosine/Sine Transforms (FCT/FST), Convolution, Correlation, and Digital Filters.

Many CXML subprograms are optimized for the supported hardware platforms. Optimization techniques include traditional optimizations such as loop unrolling and loop reordering. CXML subprograms also provide efficient management of the hierarchical memory system, using techniques such as the following:

- Reuse of data within registers to minimize memory accesses
- Efficient cache management

- Use of blocked algorithms that minimize translation buffer misses and unnecessary paging

Since CXML routines can be called from all languages that support the OpenVMS calling standard, the library provides optimized computation for applications written in these languages. Where appropriate, most subprograms are available in both real and complex versions, as well as in both single and double precision. CXML for OpenVMS Alpha supports both IEEE and VAX floating-point formats.

Basic Linear Algebra Subprograms

Linear algebra operations are fundamental to many mathematical applications, and several libraries of linear algebra subprograms exist throughout the computer industry. The CXML BLAS library contains the most commonly used linear algebra subprograms.

The CXML linear algebra library contains five groups of subprograms at three levels:

- Basic Linear Algebra Subprograms (BLAS) Level 1
- BLAS Level 1 Extensions
- BLAS Level 1 Sparse Extensions
- BLAS Level 2
- BLAS Level 3

BLAS Level 1 (Scalar/Vector and Vector/Vector Operations)

BLAS Level 1 provides a set of elementary vector functions, operating on one or two vectors. These are typically very small routines, and they make less efficient use of the computing resources of modern computer architectures than the Level 2 and 3 operations.

CXML provides the 15 standard BLAS Level 1 operations:

- The index of the element of a vector having maximum absolute value
- The sum of the absolute values of the elements of a vector
- Inner product of two real vectors
- Scalar plus the extended precision inner product of two real vectors
- Conjugated inner product of two complex vectors
- Unconjugated inner product of two complex vectors
- Square root of the sum of squares (norm) of the elements of a vector
- Scalar times a vector plus a vector
• Copy one vector to another
• Apply a Givens rotation
• Apply a modified Givens plane rotation
• Generate elements for a Givens plane rotation
• Generate elements for a modified Givens plane rotation
• Product of a vector times a scalar
• Swap the elements of two vectors

BLAS Level 1 Extensions (Vector/Vector Operations)

When developing mathematical algorithms using the BLAS Level 1, scientists and engineers found that several additional constructs were used on a regular basis. These constructs are well known throughout the computer industry as BLAS Level 1 Extensions.

CXML contains 13 BLAS Level 1 Extension operations:

- Index of element having the minimum absolute value
- Index of element having the maximum value
- Index of element having the minimum value
- Largest value of the elements of a vector
- Smallest value of the elements of a vector
- Largest absolute value of the elements of a vector
- Smallest absolute value of the elements of a vector
- Sum of the values of the elements of a vector
- Set all elements of a vector equal to a scalar
- Constant times a vector set to another vector \((y = a \cdot x)\)
- Euclidean norm with no intermediate scaling
- Sum of the squares of the elements of a vector
- Constant times a vector plus a vector set to another vector \((z = a \cdot x + y)\)

BLAS Level 1 Sparse Extensions (Vector/Vector Operations)

This group of operations is similar to the BLAS Level 1 routines, but is designed to work on sparse vectors (vectors in which most of the elements are zero). Six of the routines are from industry standard Sparse BLAS 1, and the remaining three are enhancements.

The nine sparse BLAS Level 1 operations are:

- Scalar times a sparse vector plus a vector
- Sum of a sparse vector and a full vector
- Inner product of a sparse vector and a full vector
- Gather a sparse vector from a full vector
- Gather a sparse vector from the scaled elements of a full vector
- Gather a sparse vector from a full vector and zero corresponding elements of full vector
- Apply Givens rotation to a sparse vector and a full vector
- Scatter a sparse vector into a full vector
- Scale and scatter a sparse vector into a full vector

BLAS Level 2 (Matrix/Vector Operations)

The BLAS Level 2 codes make more effective use of the data in the registers, reducing the number of register loads and stores required. In addition, loop unrolling techniques are used to minimize cache misses and page faults. The BLAS Level 2 subprograms use the following types of operations:

- Matrix/vector products
- Rank-1 and rank-2 matrix updates
- Solutions of triangular systems of equations

Six types of matrices are supported by these BLAS Level 2 routines:

- General
- General band
- Symmetric/Hermitian
- Symmetric/Hermitian band
- Triangular
- Triangular band

BLAS Level 3 (Matrix/Matrix Operations)

The BLAS Level 3 routines operate at a level that makes the most efficient use of machine resources. CXML optimizes these routines by partitioning matrices into blocks and computing matrix/matrix operations on each block. This approach avoids excessive memory accesses by providing full reuse of data while each block is in the cache or the registers. BLAS Level 3 routines provide this kind of blocking for three basic types of operations:

- Matrix/matrix products
- Rank-k and rank-2k updates of a symmetric matrix
- Solving triangular systems of equations with multiple right-hand sides
Three types of matrices are supported by these BLAS Level 3 routines:

- General
- Symmetric/Hermitian
- Triangular

A set of additional matrix-matrix routines is provided:

- Add two matrices
- Subtract one matrix from another
- Transpose a matrix, in-place or out-of-place

Array Math Functions

The Array Math Functions provide a set of basic math functions that operate on arrays of numbers rather than on scalars. On vector and superscalar architectures, such functions have a performance advantage over a loop of scalar operations. The library includes the following array functions for double precision numbers:

- Sine of array
- Cosine of array
- Cosine and sine of array
- Exponent of array
- Logarithm of array
- Square root of array
- Reciprocal of array

LAPACK Library Contents

LAPACK is a library of linear algebra subprograms intended to solve a wide range of problems in linear algebra. LAPACK can be used to solve dense systems of linear equations, linear least squares problems, eigenvalue problems, and singular value problems. It is also useful in doing other computations such as matrix factorizations and estimations of condition numbers.

The CXML LAPACK library provides the complete LAPACK v2 package. CXML’s version of LAPACK is provided as a packaged library, compiled, tested, and ready to use. Combined with the optimized BLAS Level 3 routines, the CXML LAPACK will provide optimal performance on all supported platforms. LAPACK should be used in place of LINPACK and EISPACK, because it is more efficient, accurate, and robust.

LAPACK supports both real and complex, single and double precision data. It operates on the following types of matrices:

- Bidiagonal
- General band
- General unsymmetric
- General tridiagonal
- Hermitian
- Hermitian, packed storage
- Upper Hessenberg, generalized problem
- Upper Hessenberg
- Orthogonal
- Orthogonal, packed storage
- Symmetric/Hermitian positive definite band
- Symmetric/Hermitian positive definite
- Symmetric/Hermitian positive definite, packed storage
- Symmetric/Hermitian positive definite tridiagonal
- Symmetric band
- Symmetric, packed storage
- Symmetric tridiagonal
- Symmetric
- Triangular band
- Triangular, generalized problem
- Triangular, packed storage
- Triangular
- Trapezoidal
- Unitary
- Unitary, packed storage

LAPACK provides the following operations:

- Triangular factorization
- Unblocked triangular factorization
- Solve a system of linear equations (based on triangular factorization)
- Compute the inverse (based on triangular factorization)
- Compute a split Cholesky factorization of a symmetric/Hermitian positive definite band matrix
- Unblocked computation of inverse
- Estimate condition number
- Refine initial solution returned by solver
- Perform QR factorization without pivoting
- Unblocked QR factorization
- Solve linear least squares problem (based on QR factorization)
• Solve the linear equality constrained least squares (LSE) problem
• Solve the Gauss-Markov linear model problem
• Perform LQ factorization without pivoting
• Unblocked LQ factorization
• Solve underdetermined linear system (based on LQ factorization)
• Generate a real orthogonal or complex unitary matrix as a product of Householder matrices
• Unblocked generation of real orthogonal or unitary matrix
• Multiply a matrix by a real orthogonal or complex unitary matrix by applying a product of Householder matrices
• Unblocked version of multiplication of a matrix by a real orthogonal or complex unitary matrix by applying a product of Householder matrices
• Reduce a square matrix to upper Hessenberg form
• Unblocked version of square matrix reduction
• Reduce a symmetric matrix to real symmetric tridiagonal form
• Reduce a band matrix to bidiagonal form
• Unblocked version of symmetric matrix reduction
• Reduce a rectangular matrix to bidiagonal form
• Reduce a band symmetric/Hermitian matrix to tridiagonal form
• Reduce a symmetric/Hermitian-definite banded generalized eigenproblem to standard form
• Compute various norms of a complex Hermitian tridiagonal matrix
• Compute eigenvalues and optional Schur factorization or eigenvectors using QR algorithm
• Compute selected eigenvectors by inverse iteration
• Compute eigenvectors from Schur factorization
• Compute eigenvectors using the Pal-Walker-Kahan variant of the QL or QR algorithm
• For a pair of N-by-N real nonsymmetric matrices, compute the generalized eigenvalues, the real Schur form, and the left and/or right Schur vectors
• For a pair of N-by-N real nonsymmetric matrices, compute the generalized eigenvalues, and the left and/or right generalized eigenvectors
• Solve the generalized nonsymmetric eigenproblem $Ax = \lambda Bx$
• Solve the generalized definite banded eigenproblem $Ax = \lambda Bx$
• Solve the generalized symmetric/Hermitian-definite banded eigenproblem
• Solve the symmetric eigenproblem using divide-and-conquer algorithm
• Compute singular values and, optionally, singular vectors using the QR algorithm
• Compute the generalized (quotient) singular value decomposition
• Compute the generalized singular value decomposition (GSVD) on the M-by-N matrix $A$ and P-by-N matrix $B$
• Solve a generalized linear regression model problem

**Sparse System Solver Subprograms**

The CXML Sparse System Solver library contains a set of subprograms that can be used to solve sparse linear systems of equations. Two packages providing direct and iterative methods are supported.

**Direct Method Sparse Solver Package:**

The direct solver package includes skyline (profile) solvers for symmetric and nonsymmetric matrices. Separate factorization and solver routines are provided to allow repeated use of the solver for multiple right hand sides, without repeating the factorization. To make the subprograms easier to use, both simple and expert driver routines are provided. Functions provided include:

• LDU factorization
• Solve
• Norm evaluation
• Iterative refinement
• Simple and expert drivers

These storage schemes are supported for symmetric and nonsymmetric matrices:

• Profile-in storage
• Structurally symmetric, profile-in storage (for nonsymmetric only)
• Diagonal-out storage

**Iterative Method Sparse Solver Package:**

For the iterative method, the library provides a modular set of storage schemes, preconditioners, and solvers. These solvers and preconditioners are easily accessed through an integrated driver routine.
Six iterative sparse solvers for real, double precision data are supplied:

- Preconditioned conjugate gradient method
- Preconditioned least squares conjugate gradient method
- Preconditioned biconjugate method
- Preconditioned conjugate gradient squared method
- Preconditioned generalized minimum residual method
- Preconditioned transpose free QMR method

Routines for three storage schemes are provided, or the user can develop routines to employ a custom storage scheme. The supplied storage schemes include:

- Symmetric diagonal
- Unsymmetric diagonal
- General storage by rows

Three preconditioners are supplied, which can be selectively applied to the data. Users can also supply custom preconditioners. The preconditioners supplied include:

- Diagonal
- Polynomial (Neumann)
- Incomplete LU with zero diagonals added

**Sorting Subprograms**

Two sort subprograms using the Quicksort algorithm and two general purpose radix sort subprograms are provided, as follows:

- Sort elements of a vector using the Quicksort algorithm
- Sort an indexed vector of data using the Quicksort algorithm
- Sort data using a radix sort algorithm
- Sort an indexed vector of data using a radix sort algorithm

All of the above sorts operate on data stored in memory.

**Random Number Subprograms**

CXML provides four random number generator subprograms:

- Produce a vector of uniform [0,1], long-period random numbers using the L’Ecuyer multiplicative method. Two auxiliary input routines are provided to allow this subprogram to be called from within a parallel section of a program.
- Produce a vector of N(0,1), normally-distributed random numbers. Two auxiliary input routines are provided to allow this subprogram to be called from within a parallel section of a program.
- Produce single precision random numbers using a linear multiplicative algorithm
- Produce single precision random numbers using a Lehmer multiplicative generator

**Signal Processing Subprograms**

The CXML Signal Processing library contains a set of subprograms in four basic areas of signal processing:

- Fast Fourier Transforms (FFT)
- Fast Cosine and Fast Sine Transforms (FCT and FST)
- Convolution and correlation
- Digital filters

**Fast Fourier Transforms and Cosine and Sine Transforms**

CXML provides one-dimensional, two-dimensional, three-dimensional, and group FFT routines and one-dimensional FCT/FST routines. Each routine is supplied in two forms:

- The first form computes the transform in one unit operation. This is convenient for programs requiring speed on only one or a few operations.
- The second form is provided for programs requiring speed on repeated operations. With this form, each routine is subdivided into three routines. One routine builds the rotation factors, a second routine applies them to perform the transform, and a third routine deallocates any virtual memory allocated in the first routine. Thus, for repeated operations, the rotation factors need to be built only once.

**Convolution and Correlation**

CXML provides routines for computing one-dimensional discrete convolutions and correlations. These routines can process both periodic and nonperiodic data.

**Digital Filters**

CXML provides support for one-dimensional, nonrecursive digital filtering. Based on the Kaisers Sinh-Bessel algorithm, these routines allow programming of bandpass, bandstop, low-pass, and high-pass filters.
Cray SciLib Portability Support

SCIPORT is an HP implementation of v7 of the Cray Research scientific numerical library, SciLib. SCIPORT provides 64 bit single-precision and 64-bit integer interfaces to underlying CXML routines for Cray users porting programs to Alpha systems running OpenVMS. SCIPORT also provides equivalent versions of almost all Cray Math Library and CF77 (Cray Fortran 77) Math intrinsic routines.

In order to be completely source code compatible with SciLib, the SCIPORT library calling sequence supports 64-bit integers passed by reference. However, internally, SCIPORT uses 32 bit integers. Consequently, some run-time uses of SciLib are not supported by SCIPORT.

SCIPORT provides the following:

- 64-bit versions of all Cray SciLib single-precision BLAS Level 1, Level 2, and Level 3 routines
- All Cray SciLib LAPACK routines
- All Cray SciLib Special Linear System Solver routines
- All Cray SciLib Signal Processing routines
- All Cray SciLib Sorting and Searching routines

These routines are completely interchangeable with their Cray SciLib counterparts up to the runtime limit on integer size, and with the exception of the ORDERS routine, require no program changes to function correctly. Owing to endian differences of machine architecture, special considerations must be given when the ORDERS routine is used to sort multibyte character strings.

RUN-TIME LIBRARY REDISTRIBUTION

The HP Fortran kit may include updated Run-Time Library shareable images. HP grants the user a nonexclusive royalty-free worldwide right to reproduce and distribute the executable version of the Run-Time Library (the "RTLs"), provided that the user does all of the following:

- Distributes the RTLs only in conjunction with and as a part of the user’s software application product that is designed to operate in the OpenVMS environment.
- Does not use the name, logo, or trademarks of HP to market the user’s software application product.
- Includes the copyright notice of HP Fortran on the user’s product disk label and/or on the title page of the documentation for software application product.
- Agrees to indemnify, hold harmless, and defend HP from and against any claims or lawsuits, including attorney’s fees, that arise or result from the use or distribution of the software application product.

Except as expressly provided herein, HP grants no implied or express license under any of its patents, copyrights, trade secrets, trademarks, or any license or other proprietary interests and rights.

The RTL image is designated as DEC$FORRTL.EXE. HP Fortran may include a separate installation kit for the purpose of installing the HP Fortran Run-Time Library. This kit, installable with the POLYCENTER® Software Installation Utility (a component of OpenVMS), must be used to install the RTL image on other systems.

HARDWARE REQUIREMENTS

Processors Supported:

Any Alpha system that is capable of running OpenVMS Alpha Version 7.3-2 or later.

OpenVMS i64 Version 8.2-1 supports all Integrity Servers.

Refer to the OpenVMS Operating System’s Software Product Description (SPD 82.35.xx) for details.

Table 2
Disk Space Requirements on OpenVMS i64 (Block Cluster Size = 1)

<table>
<thead>
<tr>
<th>TASK</th>
<th>SIZE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compiler Installation:</td>
<td>62,000 blocks (31 MB)</td>
</tr>
<tr>
<td>Compiler Permanent:</td>
<td>60,000 blocks (30 MB)</td>
</tr>
</tbody>
</table>

These counts refer to the disk space required on the system disk. The sizes are approximate; actual sizes may vary depending on the user’s system environment, configuration, and software options.
CLUSTER ENVIRONMENT

This layered product is fully supported when installed on any valid and licensed VMScluster* configuration without restrictions. The HARDWARE REQUIREMENTS sections of this product’s Software Product Description and System Support Addendum detail any special hardware required by this product.

* VMScluster configurations are fully described in the VMScluster Software Product Description (SPD 42.18.xx) and include CI, Ethernet, DSSI, FDDI, SCSI and Mixed Interconnect configurations.

SOFTWARE REQUIREMENTS

For All Systems Using Terminals DECwindows Interface:

- OpenVMS Alpha Operating System V7.3-2 & higher
- OpenVMS I64 Operating System V8.2-1 & higher

For All Workstations Running DECwindows:

- OpenVMS Alpha Operating System V7.3-2 & higher
- OpenVMS Optional Components

The OpenVMS operating system can be configured to include or omit certain components. HP Fortran requires the following components to be included:

- Programming Support
- Utilities

The default for OpenVMS Alpha installation is to include all components.

SOFTWARE LICENSING INFORMATION

A software license is required in order to use HP Fortran software. For VAX and Alpha platforms, HP Fortran is offered with Concurrent Use, Personal Use and Traditional 'capacity' licenses. For I64, it is offered with Concurrent Use licenses. Version update licenses are not available for the I64 platform. Rights to use future revisions of HP Fortran are available only through a Support Agreement or through a new license purchase. For more information about OpenVMS license terms and policies, contact your local HP sales office, or reference the Software Licensing site at: <http://licensing.hp.com/swl/view.slm?page=index>

LICENSE MANAGEMENT FACILITY SUPPORT

HP Fortran supports the License Management Facility of HP.

License units for HP Fortran on Alpha is allocated on an Unlimited System Use plus Concurrent Use basis. For HP Fortran on I64 is allocated on Concurrent Use basis.

Each Concurrent Use license allows any one individual at a time to use the layered product.

OPTIONAL SOFTWARE

- DECset V11.1-V12.7 for OpenVMS Alpha
- CDD/Repository V5.3 for OpenVMS Alpha
- DECset V12.7 for OpenVMS I64

GROWTH CONSIDERATIONS

The minimum hardware/software requirements for any future version of this product may be different from the requirements for the current version.

DISTRIBUTION MEDIA

This product is available on the HP CD-ROM Software Library for OpenVMS Alpha (QA-03XAA-H8). Documentation in printed format can be ordered separately (see the HP Fortran "read first" cover letter or the online release notes).

HP Fortran OpenVMS I64 ONLY:

HP Fortran for OpenVMS I64 is available on the OpenVMS Layered Product Library. The library package includes media and documentation on CD-ROM.

SOFTWARE WARRANTY

This software is provided by HP with a 90 day conformance warranty in accordance with the HP warranty terms applicable to the license purchase.

The above information is valid at time of release. Please contact your local HP office for the most up-to-date information.

ORDERING INFORMATION

When purchasing HP Fortran both a license and media must be ordered. The license deliverable provides the LMF PAK required to run the HP Fortran software. The VMS Operating System or Operating Environment (license and media) is a prerequisite to running HP Fortran.
